# The lambdax package\*

## Erwann Rogard<sup>†</sup>

#### Released 2021-08-18

#### Abstract

This is a IATEX package that provides 'lambda expressions', in other words an interface by which one consecutively, first, specifies the parameters and replacement code of a document-command [2], and, second, evaluates it with compatible arguments. Optionally, one can recurse. For example,  $\LambdaX[mm]<t^{\starting}_{x}_{x}_{,~}^{\starting}_{x}_{.~}^{\starting}_$

|                        | 4 Settings   | 6 |
|                        | Change History   | 8 |
|                        | 1 Settings   |   |
| wnorgo-command         | The options hereafter are load-time-only.  |   |
| xparse-command         | Side effect Sets the xparse-document-command used by \lambdax:nn   Initial \DeclareDocumentCommand   |   |
|                        | 2 Programming  |   |
| \lambdax:nn            | $\verb \lambdax:nn{ \argspec }{(code)}{(args)}$  |   |
|                        | Expands to $\langle code \rangle$ , $\langle args \rangle$ replacing the parameters implied by $\langle argspec \rangle$   |   |
| \lambdax:nnn           | $\verb \ambdax:nn{ \argspec }{(code)}{(bool-arg-type)}{(args)\langle bool-arg }$   |   |
|                        | Limitation That of keyparse[4]'s argspec collection.  Argspec Examples of $\langle bool\text{-}arg\text{-}type\rangle[2]$ and $\langle bool\text{-}arg\rangle$ are s and *, respectively.  Semantics That of \lambdax:nn and recurse if applicable.  |   |
| \lambdax_xcmd_if:NTF * | $\label{lambdax_xcmd_if:NTF:Nn} $$ \arreverselse for the content of the content $ |   |
|                        | 3 Document   |   |
| \LambdaX               | $\label{lambdaX[(argspec)]<(bool-arg-type)>{(code)}} % \end{substitute} % \begin{substitute} \begin{substitute}(c) substitut$        |   |
|                        | Adapts \lambda:nn and \lambda:nnn  |   |

# Part II Other

#### Acknowledgment 1

The basis for \lambdax:nn originates with [1]. Except for chaining, it was already provided by [3].
